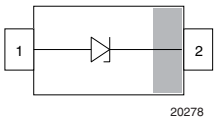
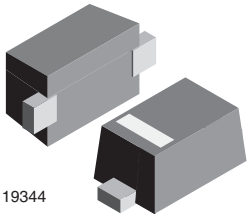
Single ESD Protection Diode in SOD-523



20278



19344

FEATURES

- Single-line ESD protection
- ESD immunity acc. IEC 61000-4-2
  ± 30 kV contact discharge
  ± 30 kV air discharge
- Typ. capacitance = 130 pF
- Leakage current I_R < 1 µA (V_R = 5 V)
- e3 - Sn
- Material categorization:
  for definitions of compliance please see www.vishay.com/doc?99912

BiAs-MODE (bidirectional asymmetrical protection mode)

With the VESD05A1-02V one signal- or data-lines (L1) can be protected against voltage transients. With pin 1 connected to ground and pin 2 connected to a signal- or data-line which has to be protected. As long as the voltage level on the data- or signal-line is between 0 V (ground level) and the specified maximum reverse working voltage (V_{RWM}) the protection diode between data line and ground offers a high isolation to the ground line. The protection device behaves like an open switch.
As soon as any positive transient voltage signal exceeds the break through voltage level of the protection diode, the diode becomes conductive and shorts the transient current to ground. Now the protection device behaves like a closed switch. The clamping voltage (V_C) is defined by the breakthrough voltage (V_{BR}) level plus the voltage drop at the series impedance (resistance and inductance) of the protection device.
Any negative transient signal will be clamped accordingly. The negative transient current is flowing in the forward direction of the protection diode. The low forward voltage (V_F) clamps the negative transient close to the ground level.
Due to the different clamping levels in forward and reverse direction the VESD05A1-02V clamping behavior is bidirectional and asymmetrical (BiAs).
